lay their eggs on the winter host. Generally speaking, aphids multiply most rapidly under warm, dry conditions.

**Economic importance:** Whilst the direct damage caused by huge populations of aphids feeding on any fruit tree can be quite considerable, their greatest danger lies in their ability to transmit virus diseases. Perhaps the best known of the viruses commonly associated with aphids are leaf roll and mosaic of potatoes (vectors — *Myzodes persicae* and others) and virus yellows of sugar beet (vectors — *Myzodes persicae*, *Doralis fabae*). In addition, a number of virus diseases of fruit, particularly soft fruit, have, during the past few years, been recognised as being spread by aphids.

**Control:** During the dormant season the eggs may be destroyed by spraying with 1% Selinon (1 kg. product per 100 litres water) using a drenching spray, or Folidol Oil (0.05% Folidol-E 605 active ingredient), at the delayed dormant stage (bud-swelling). Spraying during the growing season is best carried out just before blossoming, using one or other of the following products: Folidol-E 605, Folidol M (20 g. active ingredient per 100 litres water), Metasystox(i), Metasystox R, Systox at 0.025% or Metasystox at 0.05% (active ingredient in each case). The systemic Metasystox products and Systox are particularly effective against the leaf curling aphids.

Gusathion or Gusathion A used for the control of codling moth will also destroy any aphids which may still be present at that time of year.

## Scale insects

### *Eulecanium corni* (Bch.) March.

Brown scale

European fruit lecanium

*Lecanium corni*, *L. coryli*, *L. robiniarum*, *Eulecanium xylostei*

(Napf- oder Zwetschgenschildlaus; Lécanium du cornouiller, Lécanium de la vigne; Cochinilla de la vid; Lapa da videira)

### *Lepidosaphes ulmi* L.

Mussel scale

*Mytilaspis pomorum*, *Mytilococcus ulmi*, *Coccus ulmi*, *Aspidiotus pomorum*

(Kommaschildlaus; Pou virgule, Kermès virgule, Cochenille virgule; Serpeta, Escama ostión, Coma, Queresa ceniza; Cochonilha vírgula, Escama mexilhão)

### *Phenacoccus aceris* (Sign.) Ckll.

Apple mealybug

(Schmierlaus; Cochenille blanche; Cochinilla harinosa)

### *Pulvinaria vitis* L.

Grape scale

Woolly currant scale

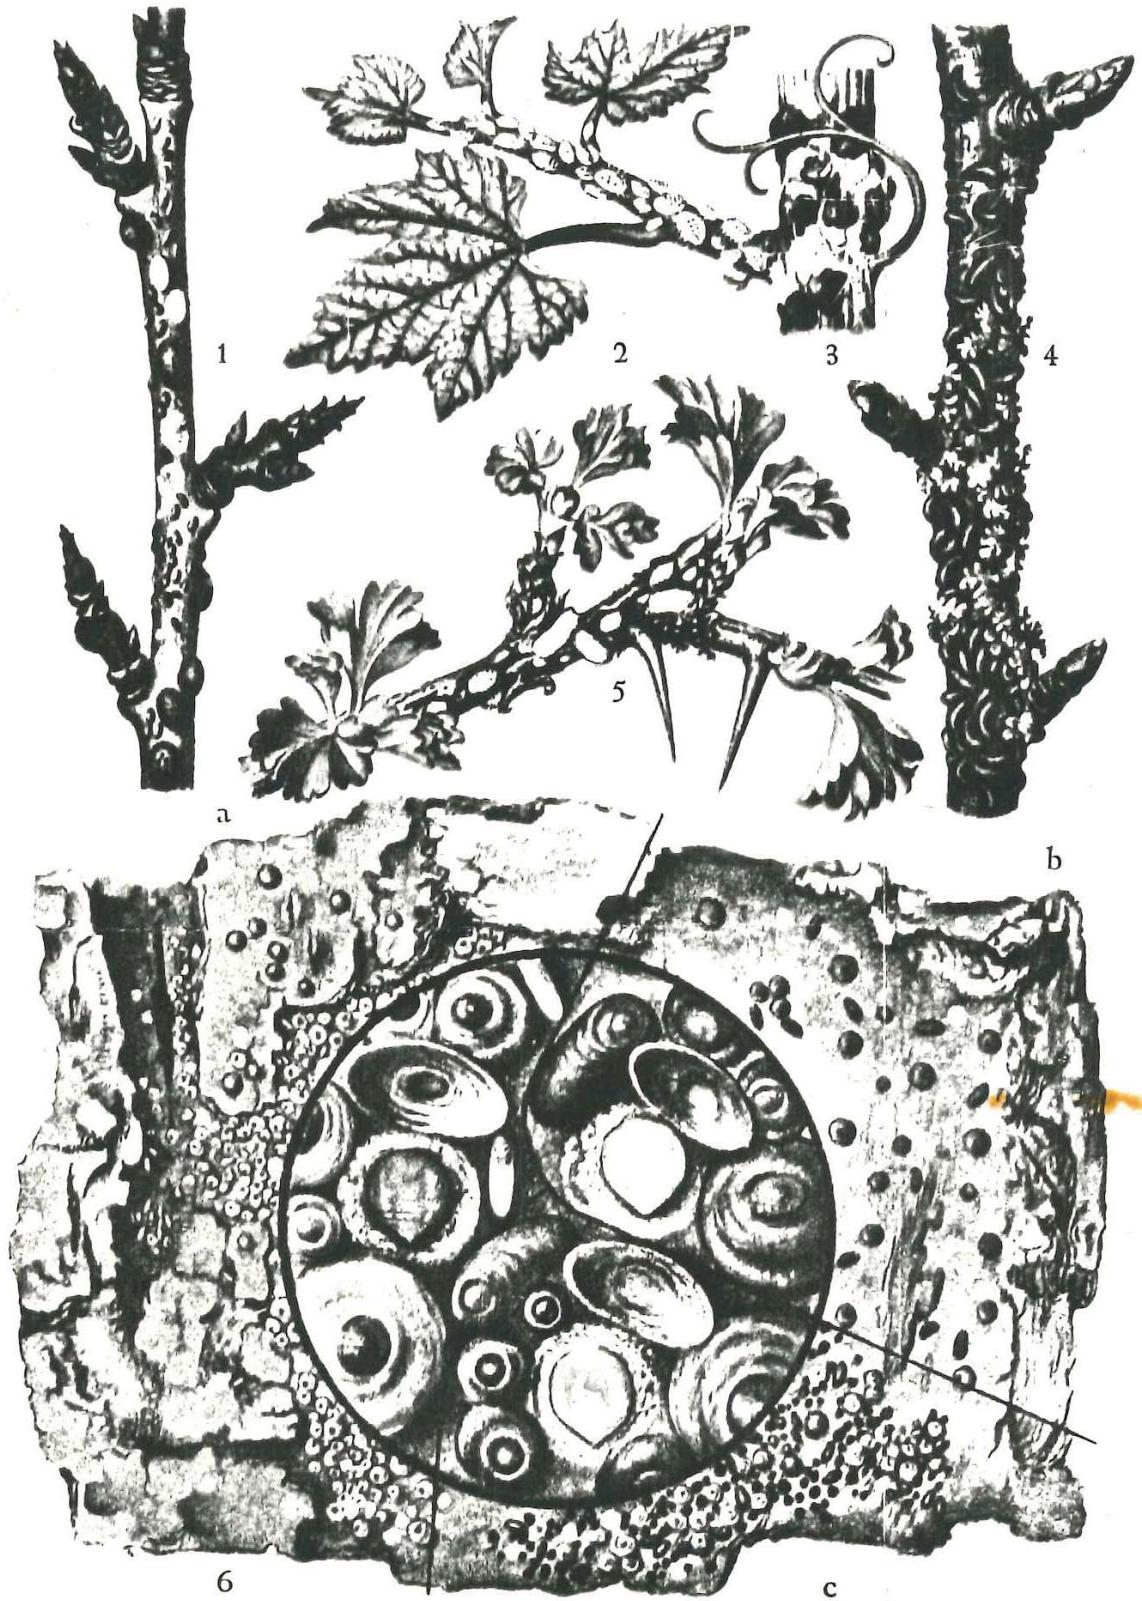

(Wollige Napfschildlaus, Wollige Rebenschildlaus; Cochenille floconneuse de la vigne, Cochenille rouge de la vigne; Cochinilla algodonosa de la vid)

### *Quadraspidiotus perniciosus* Comst.

San José scale

*Comstockaspis perniciosa*, *Aspidiotus perniciosus*, *Aonidiella perniciosa*

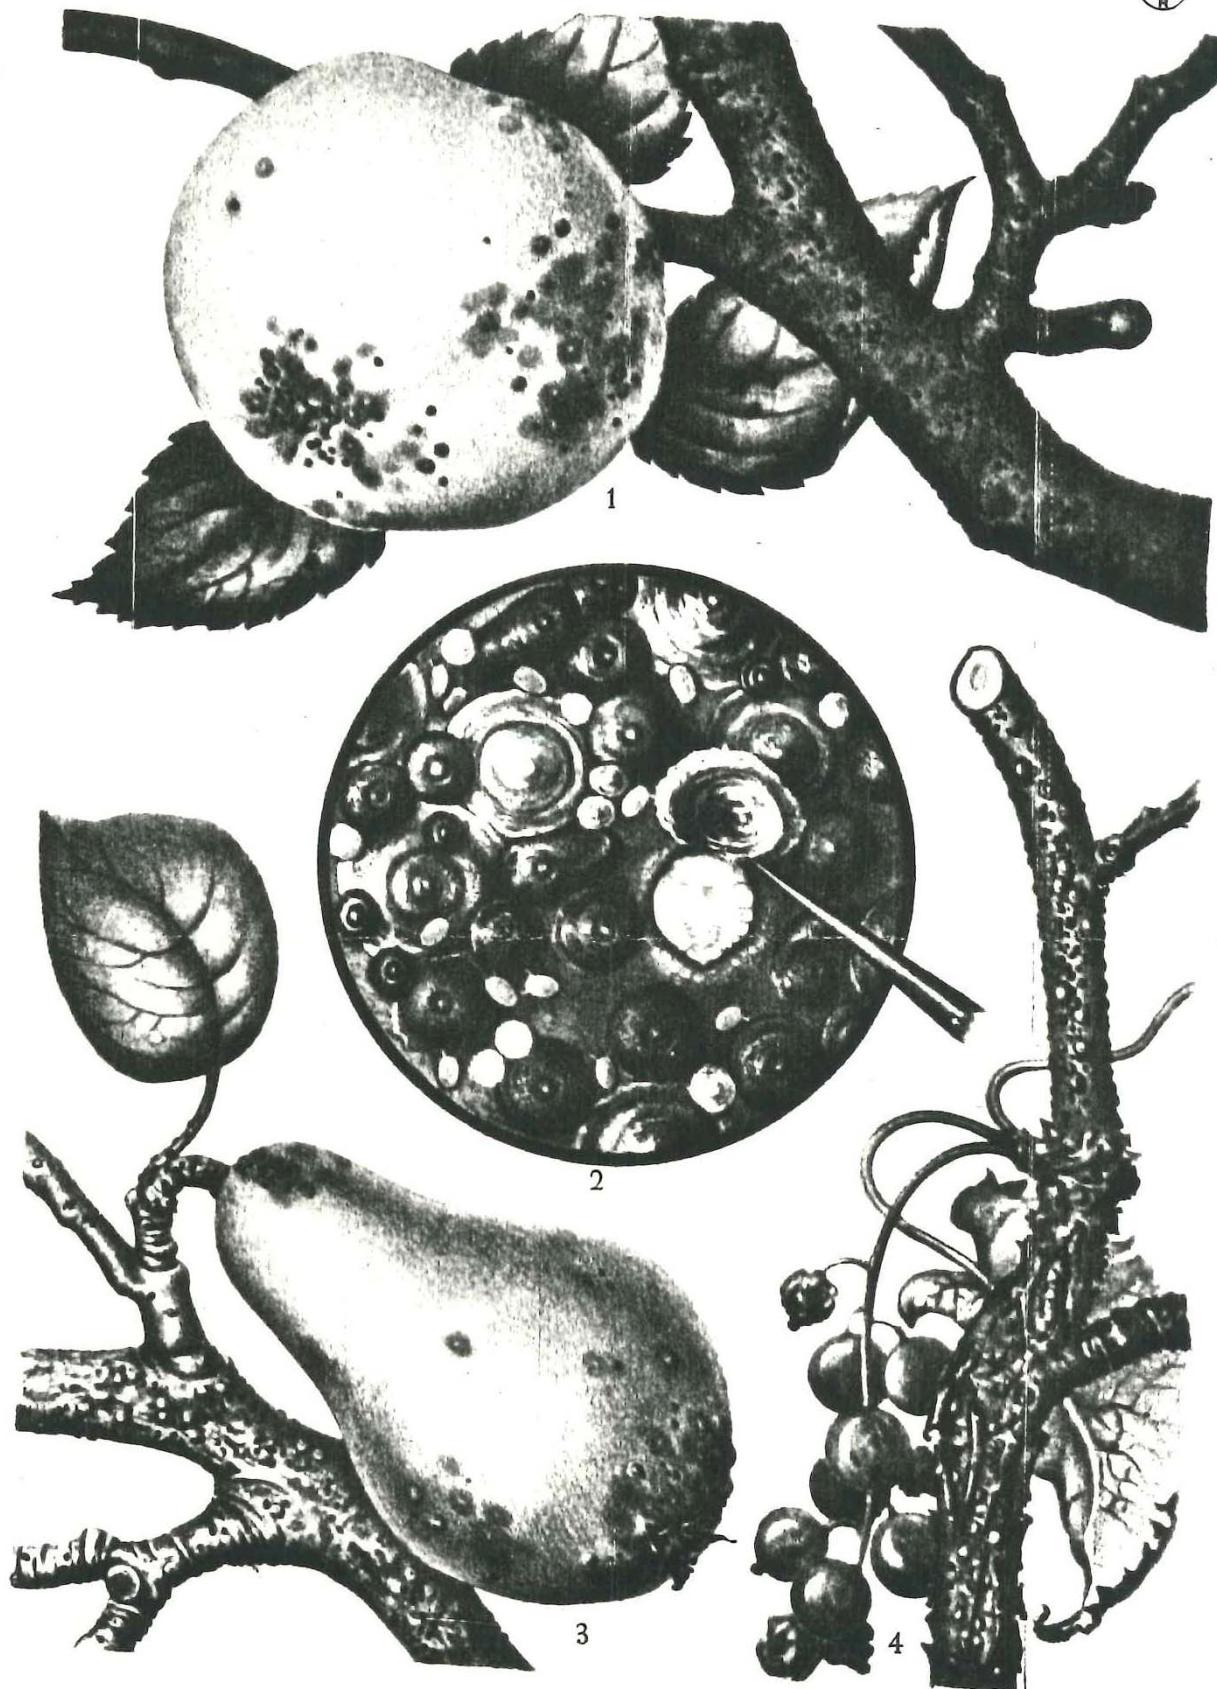

(San José-Schildlaus; Pou de San José, Cochenille de San José; Piojo o Cochinilla de San José)

### Scale insects

- 1) *Eulecanium corni* in different stages of development
- 2) *Phenacoccus aceris* on grape vine
- 3) *Pulvinaria vitis* on grape vine
- 4) *Lepidosaphes ulmi*
- 5) *Phenacoccus aceris* on gooseberry
- 6) Three species of covered scales in different stages of development on bark of fruit tree. Illustrations 1—6 in natural size. Inset (greatly magnified): Section showing a) *Epidiaspis betulae* b) *Quadraspidiotus ostreaeformis* c) *Quadraspidiotus perniciosus*

Plate 46

***Quadraspidiotus perniciosus***

- 1) Injury on apple
- 2) Magnified section showing different stages of development; on the right, scale folded back disclosing mature female
- 3) Injury on pear
- 4) Infestation on currants

***Eriosoma lanigerum***

- 1) Woolly aphid colony 1a) Young colony 2) *E. lanigerum*, wingless, with waxy exudations (greatly magnified) 3) *E. lanigerum*, winged (greatly magnified)
- 4) Cankerous galls produced as the result of woolly aphid feeding

***Quadraspidiotus ostreaeformis* Curt.**

Oystershell scale  
European fruit scale

*Aspidiotus ostreaeformis*, *A. tiliae*, *A. hippocastani*, *A. oxyacanthae*, *Diaspidiotus ostreaeformis*

(Zitronenfarbene Austernschildlaus; Cochenille ostréiforme; Cochinilla ostriforme)

***Epidiaspis betulae* Bär.**

Italian pear scale

*E. leperii*, *E. piricola*, *Diaspis pyri*, *D. fallax*, *D. leperii*

(Rote Austernschildlaus; Cochenille rouge du poirier; Conchuelita blanca o Cochinilla gris del peral; Lênde das fruteiras, Escama da pereira)

**Injury:** Scale insects may usually be found feeding on the stems and branches of fruit trees and bushes and vary considerably in shape and size. When large numbers are present whole branches may shrivel up and die. Young plants can be seriously stunted.

**Cause:** The various species of scale insect. They may be divided into three groups for ease of recognition, as follows:

**1. Covered scales (mussel, oystershell and San José scales)**

In this type of scale insect the shell can be lifted off the body like a cover. With the exception of the San José scale (*Quadraspidiotus perniciosus*) which is viviparous, all the commoner species lay eggs. The oystershell and Italian pear scales (*Quadraspidiotus ostreaeformis* and *Epidiaspis betulae*) have roundish shells whereas the mussel scale (*Lepidosaphes ulmi*) has a more elongated shell, as the name suggests, roughly the shape of a mussel. The two first-named species overwinter in the larval stage and the mussel scale as an egg under the shell of the dead parent insect. These three species have only one generation a year in Central Europe.

**2. Attached scale insects (brown scale, woolly currant scale)**

Unlike the covered scales, the shell is not removable but is formed from the thickened epidermis of the insect's back. The best known species in this group is probably the brown scale (*Eulecanium corni*). It increases very rapidly, particularly where routine spraying is not carried out, and can be a serious pest on plums, damsons and grapes. The female scales, which are a rich brown colour, are flat at first but soon become hemispherical in shape. The eggs are laid, up to 3,000 at a time, underneath the shell. They hatch in the autumn and fix themselves to loose bits of bark until the following spring. There is usually only one generation per season out of doors. This particular species secretes large quantities of honeydew on which a thick sooty mould develops.

The woolly currant scale *Pulvinaria vitis* occurs chiefly on grapes and currants. The name is derived from the white woolly material secreted by the female, which makes the insect very conspicuous. The eggs are laid in a mass of this "wool" from late spring onward. On hatching, the larvae move around for a while and then settle down to feed, when the skin on the back begins to harden and form a shell.

**3. Soft scale insects (*Phenococcus* spp.)**

In Europe the soft scale insects, which have no protective shell, are principally a pest of ornamental plants. The genus *Phenococcus* (mealybugs) does, however, attack grapes

and soft fruits, too. For scale insects on grapes see page 334. Scales on tropical and sub-tropical plants are dealt with separately on pages 402, 421, 447, 469, 470—476, 482. For soft scales under glass see page 509.

**Economic importance:** Scale insects can cause serious damage. They increase so rapidly that the plant is soon covered with a layer of scales. In addition to sucking the sap, toxic substances are frequently injected into the plant, so that serious stunting and in some cases death results.

**Control:** As scale insects are usually more damaging on plants which are already weak and sickly, it is important to improve their general condition before carrying out control measures.

During the dormant season, a spray of 1% Selinon (1 kg. of product per 100 litres of water) or in the case of San José scale a 1.5% solution should be applied, followed by a spray of Folidol Oil (0.05% Folidol-E 605 active ingredient) between bud swelling and bud burst. To prevent a build-up from occurring during the season, Folidol-E 605 (20 g. active ingredient per 100 litres water) may be added at regular intervals to the pre- and post-blossom sprays. Established infestations may be destroyed during the growing season by applying Folidol-E 605 (50—70 g. active ingredient per 100 litres water). Gusathion is also very effective for this purpose.

Brown scale is best controlled by spraying pre-blossom with Folidol-E 605 (20 g. active ingredient per 100 litres water) before the newly hatched larvae have formed a protective scale.

#### NOTES:

## ***Quadraspidiotus perniciosus* Comst.**

San José scale

*Comstockaspis perniciosa*, *Aspidiotus perniciosus*, *Aonidiella perniciosa*

(San José-Schildlaus; Pou de San José, Cochenille de San José; Piojo o Cochinilla de San José)

**Injury:** The insects, which are a greyish colour surrounded by a red ring, are found all over the tree, on the twigs, leaves and fruits. In severe cases the trees appear as if they were covered with ash. To begin with, the tips of the young shoots die back but later whole branches or even trees may die. Apples, pears and currants are most readily attacked.

**Cause:** The San José scale (*Quadraspidiotus perniciosus*). The females produce living larvae, which are pale yellow in colour and about 0.2 mm. in length. They move about at first but soon settle down to feed and begin to form the scale. At the first moult the female scales lose their legs, feelers and eyes and become incapable of moving. After one or more further moults they reach their full size which may be up to 1.5 mm. in diameter. The male scales are elliptical in shape and have eyes, legs, feelers and wings but, unlike the females, have no feeding proboscis. Each female produces between 100 and 400 larvae. In Central Europe there are two, or at the most three, generations a year but in other parts of the world there may be as many as four or five. In Central Europe they overwinter in the immature stage. San José scale originally came from China but was discovered near San José in California during 1872. From there it has spread to most of the fruit growing countries of the world.

**Economic importance:** The San José scale is one of the most serious pests of fruit crops and in Germany alone has caused enormous damage since 1942. In addition to ruining the trees and rendering the fruits unsaleable, the cost of inspection and control measures is considerable.

**Control:** In Germany, the presence or suspected presence of San José scale in an orchard must be notified immediately to the appropriate pest control authority. During the dormant season 1.5% Selinon (1.5 kg. product per 100 litres water) is recommended. Equally successful is a bud swelling application of Folidol Oil (0.05% Folidol-E 605 active ingredient). During the growing season Folidol-E 605 should be used at a concentration of 30 g. active ingredient per 100 litres water. If this high concentration is used for the control of codling moth (see page 310) at the recommended timings both pests will be controlled at the same time. In fact, if routine applications of Folidol-E 605 are made for control of other pests San José scale is rarely serious.

Gusathion (50—75 g. active ingredient per 100 litres water) is also effective against this pest.

## ***Eriosoma lanigerum* Hausm. Woolly apple aphid, Woolly aphid**

American blight

*Aphis lanigera*, *Myzoxylus mali*, *Schizoneura lanigera*, *Eriosoma mali*, *E. lanata*, *E. ulmi*  
(Blutlaus; Puceron lanigère; Pulgón lanígero, Pulgón de sangre; Pulgão lanígero)

**Injury:** The first sign of this pest is a white, woolly down which appears on the shoots, twigs and in cracks in the bark. The reddish coloured aphids live beneath this "wool" which acts as a protective covering. Young shoots, cankers and unprotected wounds are most readily attacked. Corky galls are formed on the infested parts due to the feeding activities of the insects.

**Cause:** The damage is caused by the woolly apple aphid (*Eriosoma lanigerum*), and the white "wool" is produced by the secretion of a waxy substance. The aphid overwinters in wounds, cankers and, in some areas, on the base of the trunk and the root itself. Very little wool is secreted at this stage so the insect is not conspicuous. Winged forms are produced during the summer and these fly or are blown onto adjacent trees where they set up fresh colonies. Woolly apple aphid is usually more serious in a warm season. It originated in North America and was imported into Europe towards the end of the 18th century.

**Economic importance:** In severe cases where extensive cankering occurs, whole branches may be killed and the tree stunted. The woolly apple aphid is also sometimes troublesome in tree nurseries where it may attack newly grafted stocks and render them unsaleable. Some varieties are more susceptible than others.

**Control:** Control measures are most effective if carried out during the pre-blossom period before the insect has had time to produce its waxy protective covering. It is, therefore, recommended that a spray of Folidol Oil (0.05% Folidol-E 605 active ingredient) be applied at the mouse-ear stage. For later sprays use Folidol-E 605, Folidol M (30 g. active ingredient per 100 litres water) or Gusathion (40—50 g. active ingredient per 100 litres water). Metasystox at 0.05% and Metasystox(i) or Metasystox R at 0.025% (active ingredient in each case) are also effective. During the growing season when the "wool" is present, high volumes and high pressures are recommended.

In nurseries, a dressing of Folidol Dust is particularly effective.

In addition to carrying out the above control measures it is advisable to dress any large wounds and pruning cuts with a wound paint or canker cure to prevent woolly apple aphid from becoming established.

Sağlık Sıhhat haberlerinizi almak  
seviniz, bizlerde hândolam  
iğiyiz.  
Burada günlerin nasıl geçtiğini  
anlatırsam çok üzüm yazmam, basmaz  
agutmaz gelsin, Cahit Agabeyim hasta  
insaallah en çok hâle zifasını verir  
oyna ben gördüm çok eğlenceliydi  
haberlerinizi almak. Hemen her gün gidi-  
yoruz görmeje; elinden bir şey gelme-  
sede.

Birincil dayıceğem ben burada aus-  
tera, arastera en nihayet on çok  
sizin isimine garaya bullelkı bir  
kitap buldum gönderiyez. Berci  
biraz eski leviha ama ben söyle bolbum  
iji. Bu hatalı Etlik Bakteriyoloji  
enstitüsüden buldum. Orada sindi-  
taruk hastalıkları Lake. Sofi olan  
Yavuz Bey size adresini gönderiyez  
firmada pratik davulculuk için geyet  
hüllancılığı iki nesnayı buldum  
mükemmət ediləsə eklem biləcəm  
söyledi. Siz bir zahmet telefonlar  
sərum olunur.

Inşallah geldiğinde soyasuya  
görünüş hissəsinə üzərə sözleşmə  
sevər vərmişəm ben, lakin, Aysə

Zeynep sizin ve huy metli yengemin  
ellerinizden hürmetle öpər her zaman  
olduğu gibi iyish haberleriniz  
bekləriyiz.

Əlhamz  
Dikret
